

Afraid of change? Don't be.

To undertake major changes to flight scheduling, travel teams can experience a significant drain on their resources. The moves can be very complex and they require forward planning to successfully manage all aspects of people logistics.

Add to the above, the requirement to bring SAM data into alignment and the task can begin to feel overwhelming.

When extensive changes occur to air charter contracts, the main objectives of the team responsible for managing the logistics are:

- To model options and their effects to assist with identifying a best-fit solution
- Effect the bulk changes with minimal interruption to operations
- Minimise the time taken to implement these changes

How much easier would it be if you had access to expert advice and assistance to guide you through these changes? The experienced team at Vix are available to help you through it, ensuring you quickly meet your objectives.

Your need to quickly identify the simplest approach can be easily achieved by taking advantage of our industry experience and product knowledge. Additionally, your team can be saved many hours of work by utilising our ability to perform bulk system changes.

The Situation

If you have ever been responsible for implementing changes of this magnitude, you would be aware that to arrive at the most suitable solution for your operation, the level of effort required can be quite high, and the process can be confusing!

It is also very difficult to see the impact of the transport changes on other people logistics issues – such as accommodation and rosters.

The Approach

The approach is very much a consultative one. Your team understands what they want to achieve. By working closely with them, Vix gathers the necessary information to support the proposed changes.

Once your requirements have been gathered, a modelling or testing environment is created. The environment contains your existing travel, accommodation, people and roster details.

The changes are then applied to the modelling environment quickly and simply, allowing you to easily view the impact of proposed changes without it affecting your live data. Multiple scenarios can also be modelled in this environment to quickly identify the best fit changes to suit your operation.

There is no effect to your production system and operations until the best model for change has been determined and signed off on. You maintain full control. Once signed off, a bulk update can be performed on your production system at a time that best suits your operations to ensure minimal interruption to service.

The Outcome

Choosing this service ensures:

- The impact of the changes can be visually inspected, allowing you to identify issues before the changes are implemented
- Changes can be quickly and easily made and rolled back with no effect to your day-to-day operations
- A variety of solutions may be presented to management for their final decision
- The process is less resource intensive
- Timely results
- Minimal interruptions to operations and service during implementation to production
